

Local Exhaust Ventilation (LEV) Testing

LEV, is an extract ventilation system which removes pollutants such as dusts, mists, gases, vapour or fumes from the air.

LEV is a critical service owing to the growing pressure on companies to limit their environmental footprint and to avoid injury to employees. In approximately 10% of UK businesses, there is some respiratory exposure risks from; dust, mist, gas or vapour.

Cammach provides a portfolio of services for LEV (Local exhaust ventilations) which includes the design, supply, installation, commissioning and maintenance of equipment to ensure that your company is meeting these requirements as laid out by Regulation 9 of COSHH and the HSG 258 guidance notice.

Under the current Control of Substances Hazardous to Health Relations (CoSHH), Local Exhaust Ventilation systems (LEV) require testing every 14 months. Cammach's LEV testing service ensures that client systems comply fully with all COSHH LEV regulations and guidelines.

LEV testing will collect and analyse the air which contains contaminants and provide information to ensure that a filter system is designed to remove the contaminants efficiently.

Our LEV inspectors are qualified to British Occupational Hygiene Society (BOHS) P601 standard in commissioning and thorough examination and testing of LEV.
